1

A diagram illustrating a Git repository structure. It features a large, dark blue rounded rectangle representing the repository. Inside this rectangle is a smaller, lighter blue rounded rectangle representing the 'Master Branch'. The number '1' is displayed inside a white circle within the 'Master Branch' rectangle.

# Git Commands

-status and initial

First check that git is installed.

Then check git status.

If there is no git repository, initial git.

```
# get git version
```

```
$ git --version
```

```
# get git status
```

```
$ git status
```

```
# initial git for current repository
```

```
$ git init
```

# Git Commands

## -configuration

Set email and username (If you didn't do that before).

```
# show git configuration
```

```
$ git config --list
```

```
# set email and username
```

```
$ git config --global user.email "<email>"
```

```
$ git config --global user.name "<Your Name>"
```

```
# unset email and username
```

```
$ git config --global --unset user.name
```

```
$ git config --global --unset user.email
```

```

```
$ git add .
```

```
# remove file from staging area
```

```
$ git restore --staged <file name>
```

```

# Head

**HEAD** refer to current branch.

It can also refer to a commit. In this case we are in **Detached HEAD** mode.

# Undoing Changes

-Three tree

What is **Three tree**?

They are node and pointer-based data structures that Git uses to track a timeline of edits.[bit]

- The Working Directory
- Staging Index
- Commit History

# Three tree

-The Working Directory

Current state of repo

```
$ ls
```

# Three tree

-Commit History

```
$ git log
```

# Three tree

-Staging Index

```
$ git ls-files
```

```
$ git ls-files --stage
```

# Three tree

The git **status command** output displays changes between the Commit History and the Staging Index.

# Undoing Changes

## -Working Directory Files

- Move the file from working directory to trash
- `$ git rm <file name>`
- `commit`

# Undoing Changes

## -Unstaged Changes

```
# remove unstaged changes in a file
```

```
$ git checkout <filename>
```

```
# or
```

```
$ git restore <filename>
```

```
# remove unstaged changes in all files
```

```
$ git checkout .
```

```
# or
```

```
$ git restore .
```

# Undoing Changes

## -Unstaged Changes

```
# remove untracked file
```

```
# first check what will be removed
```

```
$ git clean -dn
```

```
# then force delete that
```

```
$ git clean -df
```

# Undoing Changes

-Staged Changes

```
# unstage staged file  
$ git restore --staged <file name>
```

# Undoing Changes

-Reset

```
git reset [--soft | --mixed | --hard] [<commit>]
```

# Undoing Changes

-Reset

This resets the **current branch head** to `<commit>` and possibly updates the **staging index** (resetting it to the tree of commit) and the **working tree** depending on **mode**. [git]

# Reset

-how it works?

`git reset` is similar in behavior to `git checkout`.

`git checkout` operates on the `HEAD` ref pointer.

`git reset` will move the `HEAD` ref pointer and the current branch ref pointer. [bit]

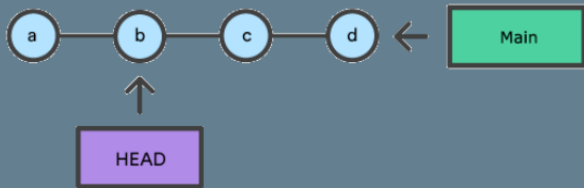

# Reset

-how it works?

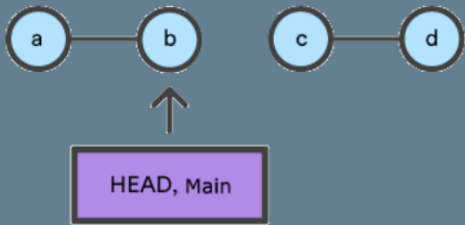

# Reset

-git checkout b

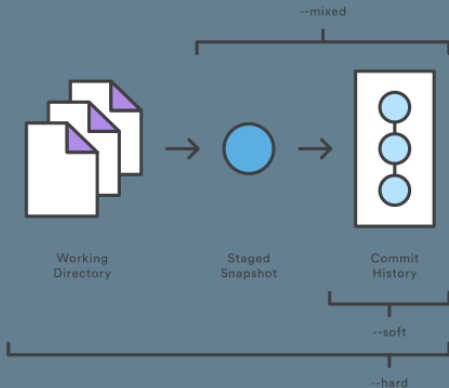

# Reset

-git reset b

# Reset

## -Main Options

# Undoing Changes

-Latest Commit(s)

```
# keep new files staged
```

```
$ git reset --soft HEAD~1
```

```
# keep new files unstaged
```

```
$ git reset --mixed HEAD~1
```

```
# remove new files
```

```
$ git reset --hard HEAD~1
```

# Undoing Changes

## -Branches

```
$ git branch -D <branch name>
```

# Gitignore

.gitignore file contains file that you don't want to track in git management.

you should create it in work directory.

each line one record.

- '<filename>' ignores file
- '\*.<extension>' ignore all files with a extension
- '!<file name>' remove file from being ignored
- '<dir>/' ignores all files in directory

check this [Web page](#) for some gitignore files.

# Restore Data

```
# check logs by following command
```

```
$ git reflog
```

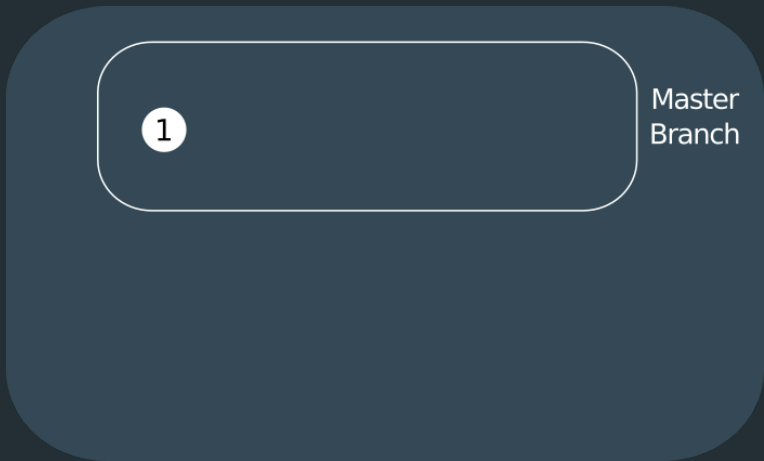

```
# moving head to a commit
```

```
$ git checkout <commit>
```

```
# moving branch pointer to a commit
```

```
$ git branch -f <branch-name> <sha1-commit-hash>
